## Overview

Glass Canopy Systems are architectural structures installed above building entrances to provide weather protection while maintaining transparency and modern aesthetics. These systems use tempered laminated glass panels supported by stainless steel or aluminum structures.

Give some space between lines. (very little so it looks good and more readable) **make a proper judgement**

**Aluminum** change to **Aluminium** at 3 places.

## Overview

Interior Glass Solutions enhance interiors with transparency, light, and modern aesthetics. These systems use tempered or laminated glass to create functional, safe, and visually open spaces.

## 2-Sided Structural Glazing

In two-sided structural glazing, glass panels are bonded on two sides with structural silicone, while the other two sides are supported using **aluminum** pressure plates or caps.

This system provides a balance between structural performance, installation.

High-strength **aluminum** framing systems

### Key Components

Structural Silicone Sealants

High-strength aluminum framing systems

Tempered and laminated safety glass

Stainless steel spider fittings (for point-supported systems)

Weather-resistant gaskets and sealing systems

Thermal insulation systems for energy efficiency

### Advantages of Structural Glazing Systems

Structural glazing systems provide multiple architectural and functional benefits for modern buildings.

#### ✓ Contemporary Architectural Appearance

Structural glazing creates sleek, frameless glass facades, giving buildings a modern and visually striking appearance.

#### ✓ Maximum Natural Light

Large glass surfaces allow abundant natural daylight, improving interior comfort and reducing reliance on artificial lighting.

#### ✓ High Structural Strength

Structural silicone bonding technology ensures secure glass attachment while maintaining flexibility for wind loads

#### ✓ Energy Efficiency

Advanced glazing systems such as double glazing and insulated glass units (IGU) improve thermal insulation and reduce energy consumption.

Key Components must align with Text as per **Figma design**.

## Overview

**Aluminum** Windows and Door Systems offer strength, durability, and modern aesthetics. Lightweight yet strong frames make them ideal for residential and commercial projects.

Give some space between lines. (very little so it looks good and more readable) **make a proper judgement**

## Types of **Aluminum** Systems

| Parameter      | Specification             |
|----------------|---------------------------|
| Frame Material | High-grade Aluminum Alloy |

## Key Components

 Aluminum alloy frames

 Tempered / laminated glass

 Weather sealing gaskets

 Stainless steel hardware

 Locking systems

### Key Components

- Structural Silicone Sealants
- High-strength aluminum framing systems
- Tempered and laminated safety glass
- Stainless steel spider fittings (for point-supported systems)
- Weather-resistant gaskets and sealing systems
- Thermal insulation systems for energy efficiency

### Advantages of Structural Glazing Systems

Structural glazing systems provide multiple architectural and functional benefits for modern buildings.

- ✓ Contemporary Architectural Appearance  
Structural glazing creates sleek, frameless glass facades, giving buildings a modern and visually striking appearance.
- ✓ Maximum Natural Light  
Large glass surfaces allow abundant natural daylight, improving interior comfort and reducing reliance on artificial lighting.
- ✓ High Structural Strength  
Structural silicone bonding technology ensures secure glass attachment while maintaining flexibility for wind loads
- ✓ Energy Efficiency  
Advanced glazing systems such as double glazing and insulated glass units (IGU) improve thermal insulation and reduce energy consumption.

| Parameter       | Standard Specification   |
|-----------------|--------------------------|
| Panel Thickness | 3mm, 4mm (Standard), 6mm |

Fix the Header spacing and below spacing as per design

|                    |                                               |
|--------------------|-----------------------------------------------|
| Fixing System      | Tray System (Rout & Return) or Riveted System |
| Weather Resistance | Excellent UV, Acid, and Alkali resistance     |
| Lifespan           | 20 – 30 Years                                 |

Types of ACP Cladding  
divided in 2 rows

### Exterior ACP Cladding

Used for building exteriors where weather resistance and durability are required.

**Aluminum** change to **Aluminium** at 4 places.

## Overview

Glass Partition Systems create functional spaces while maintaining openness and natural light. These systems use tempered or laminated glass with **aluminum** or steel supports, making interiors modern, efficient, and visually spacious.

### **Aluminum** Framed

Strong + flexible design  
Integrated doors  
Offices & retail spaces

## Technical Specifications

| Parameter  | Standard Specification |
|------------|------------------------|
| Glass Type | Tempered / Laminated   |
| Thickness  | 8–12 mm / 20–24 mm     |
| Frame      | <b>Aluminum</b> / SS   |

# Key Components

Tempered / laminated glass

Aluminum / SS frames

Glass doors & fittings

Sealants & gaskets

Floor & ceiling channels

<https://marsglass.vercel.app/#/services/upvc-door-systems>

### Energy Efficiency

UPVC doors provide excellent thermal insulation, helping maintain indoor temperature and reduce energy consumption.

### Weather Resistance

UPVC is resistant to moisture, corrosion, and harsh environmental conditions, making it ideal for long-term use.

### Low Maintenance

Unlike wood or metal doors, UPVC doors require minimal maintenance and do not require painting or polishing.

Energy Efficient

Storm Resistant

Dust Resistant

Noise Insulation

Low Maintenance

Pollution Resistant

Rainwater Insulation

Termite Resistant

Weather Resistant

### Sound Insulation

Double-glazed uPVC doors offer effective noise reduction, improving indoor comfort.
